

LockMagic

LockMagic provides end-to-end data encryption and compression using its patented Identity-based encryption model. You only specify the email addresses of the recipients and LM does the rest. There are no passwords to remember or certificates to manage.

As a fully transparent solution, LM does not require you to change the way you work or to use different applications. Data is encrypted at the client-side to ensure protection during transmission over insecure networks, stored in emails or other storage devices.

1. Management Free Solution

LM uses one-click encryption to encrypt data. With LM you can secure email, attachments, local files, folders, network files and removable media (USB flash drives).

2. Single Encryption Technology

Tamper free read receipts notifications are sent by LM to the users. You can restrict view, print, edit, copy and access operations to secure content.

3. Digital Rights Management

LockMagic has plug-ins for Microsoft Word and Excel that enables users to encrypt specific parts of the document and spreadsheet. Based on the user role, only the authorized parts of the document can be viewed or edited.
